

Call for chapter proposals for:
Proposed Routledge Companion to Sustainable Business Practice
Edited by Satinder Dhiman

This proposed volume focuses on the practice of business as it relates to environmental sustainability—*making responsible decisions that will reduce business’ negative impact, and potentially have a positive effect, on the local environment, global community, society, or economy.* It explores topics such as climate change, air and water pollution, water conservation, ecology and habitat, green buildings and eco-villages, sustainable food systems, waste management and recycling, energy conservation and renewable energy, smart manufacturing and the role of sustainable business practice. A sustainable business practice is economically viable, socially responsible, and environmentally friendly. The goal in developing sustainable business practices is to create synergistic strategies that preserve the long-term viability of People (through social responsibility), Profit (by creating economic value) and Planet (through environmental stewardship)—the proverbial triple bottom line. Sustainable business practices show strategically how “doing good” can have a direct impact on a company’s ability to “do well.”

This volume will chronicle the best current sustainable practices and map future trends in sustainability.

Sustainable Business Practices: Mapping Current Practices and Future Trends:

The suggested chapter proposals will pertain to one or more of the following sections:

- A. Climate Mitigation and Carbon Neutrality
- B. Green Business Practices
- C. Circular Economy and By-Product Synergy
